SOBRE

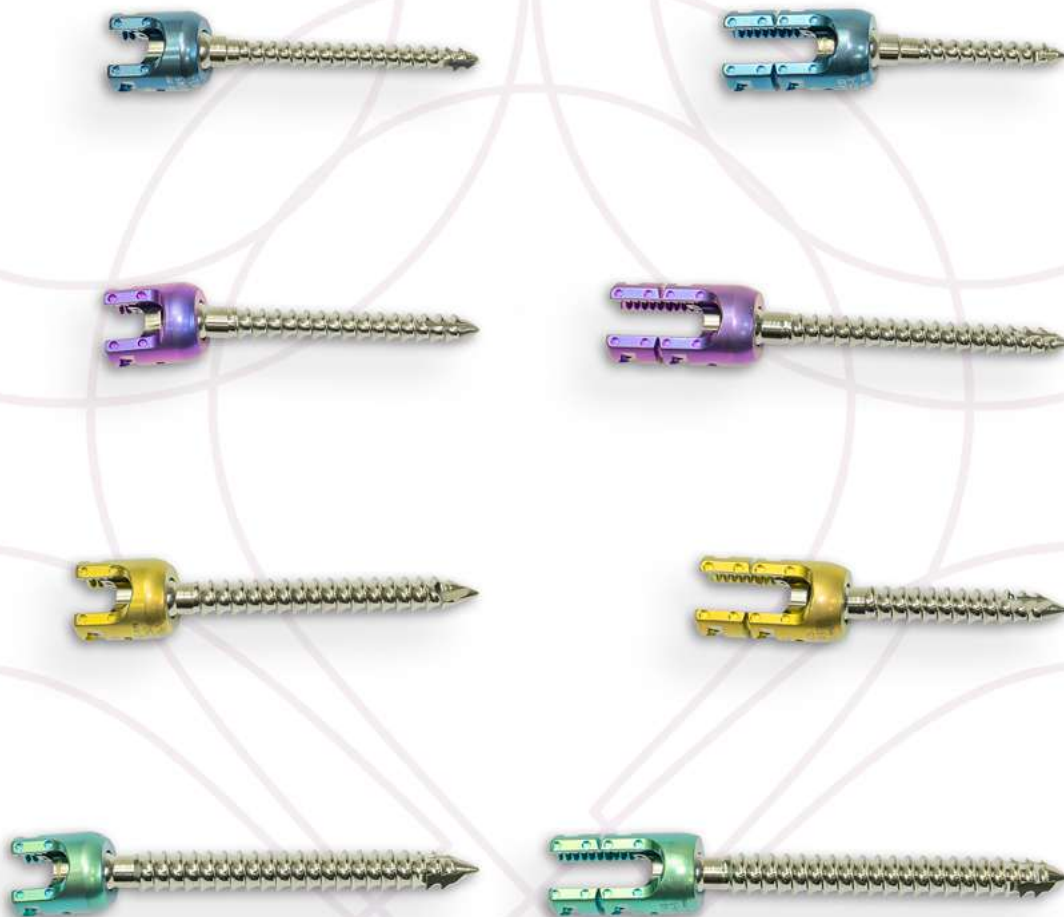

O que é?

O Sistema de Fixação Posterior Easy Plus é um dispositivo médico implantável de sistema aberto, desenvolvido para a estabilização, correção e fusão da seção tóraco-lombo-sacral da coluna vertebral. Fabricado em Liga de Titânio de alta resistência (Ti6Al4V – ASTM F136), o conjunto atua por ancoragem óssea segmentar via acesso posterior. Ele utiliza uma combinação modular de parafusos pediculares, ganchos, hastes longitudinais e estabilizadores transversais (cross links) com travamento rígido, promovendo a manutenção exata do espaço intervertebral até a consolidação óssea definitiva (artrodese).

BENEFÍCIOS

- 1 Estabilização Imediata:** O mecanismo de travamento rígido por contra parafusos garante suporte mecânico absoluto logo após a implantação, limitando totalmente o movimento da área afetada.
- 2 Correção em Procedimento Único:** Desenvolvido para promover o alívio rápido dos sintomas e a correção estrutural de deformidades em uma única intervenção cirúrgica.
- 3 Alta Adaptabilidade Anatômica:** As hastes longitudinais foram projetadas para serem precisamente modeladas no intraoperatório, respeitando a curvatura fisiológica e a anatomia exata de cada paciente.
- 4 Versatilidade do Sistema Aberto:** Por ser um sistema modular, permite ao cirurgião total liberdade para selecionar e combinar individualmente parafusos, ganchos e cross links, criando um planejamento cirúrgico 100% sob medida.
- 5 Eficácia Multipatológica:** Uma solução robusta e abrangente, indicada para o tratamento de patologias degenerativas, congênicas, traumáticas e neoplásicas (tumores).
- 6 Biocompatibilidade de Alta Performance:** A liga de titânio (Grau 5) assegura máxima resistência à fadiga mecânica, suportando as cargas da coluna lombar sem falhas até a fusão completa.
